Dear Hiring Team,

I am a full-stack engineer who ships customer-facing product, end to end. I am writing because I want to spend the next chapter of my career at the frontier – on a team that puts software in front of real users and iterates on what they actually do.

As AI Engineer at WheelPrice, I owned the React / Node.js / MongoDB CMS subsystem powering 10–20K daily users: Redis caching, server-side rendering, dynamic SEO pipeline, and a 1.5s → 300ms API latency win via query plan optimization and connection pooling. I also built the internal analytics dashboard with XGBoost churn prediction and event-driven behavior tracking. Before that, I shipped MockFlow-AI (live) – a real-time voice interview platform: Flask + LiveKit + Supabase + Monaco editor + WebRTC, sub-400ms end-to-end latency, JWT authentication, and a BYOK architecture so every user owns their model keys. As Founding LLM Engineer at alfred_, I build production multi-agent infrastructure in TypeScript for a consumer assistant serving 5K+ active users.

I work across the stack because that is where leverage is. I built and shipped MedRAG / IVORY, a healthcare conversational AI with FastAPI + Cosmos DB + Azure Speech Services at under 250ms end-to-end latency. My research backbone includes MetaRAG (IEEE CAI 2026, accepted), deployed on AWS SageMaker at p99 under 300ms. I won the MIT XR Hackathon and presented at INFORMS Analytics+ to 700+ professionals.

I am a builder. Vertical slices, design to production, no waiting for permission to figure something out. If your team is shipping product that real users touch every day, I would love to be part of it.

Thanks for your time, and I look forward to talking.

Sincerely,
Pranav Mishra
